Stochastic Process

N step transition probability:

$$P_{ij}(n) = \sum_{k=1}^{m} P_{ik}(n-1) P_{kj}(1), P_{ij}(2) = \sum_{k=1}^{m} P_{ik} P_{kj} & P_{ij}(3) = \sum_{k=1}^{m} \sum_{l=1}^{m} P_{jk} P_{kl} P_{lj}$$

N step transition probability matrix:

$$P^{(2)} = P * P \& P^{(3)} = P^{(2)} * P$$
 Markov Chain Steady State distribution : $\pi_x = \lim_{h \to 0} P_h(x)$.

When steady state distribution exists $\pi P = \pi$.

Binomial Process:

 $\lambda = arrival\ rate\ (p/\Delta), \Delta = \ frame\ size, P = probability\ of\ success\ during\ one\ frame, X\left(\frac{t}{\Delta}\right) = \ number\ of\ arrivals\ by\ time\ t, T = \ inter\ arrival\ time,\ n = t/\Delta$ $T = Y\Delta, E(T) = E(Y\Delta) \Rightarrow \Delta E(Y) = > \frac{\Delta}{p} = 1/\lambda, \ V(T) = V(Y\Delta) \Rightarrow \Delta^2 V(Y) = (1-p)(\Delta/p)^2 \Rightarrow (1-p)/\lambda^2$
